

Project Profile: Carbon Black Drum Pelletizer

PROCESS

FEECO was tasked with manufacturing a <u>rotary drum pelletizer</u>/agglomerator for use in a carbon black production plant. The drum featured a 10' interior diameter and was 20' in length.

Due to the harsh processing conditions expected during duty, FEECO fabricated the drum with heavy-duty features, including a gear-and-pinion drive assembly, heavy structural steel bases, and graphite block lubricators to prevent excessive wear on tires and trunnion wheels.

FEECO employed a labyrinth seal at both the inlet and discharge ends for cost-effective sealing of the drum to its breechings.

FEECO was chosen for this project due to our reputation in building the world's best rotary drum equipment.

PROJECT SPECS

Customer:

Proprietary

Equipment Supplied:

Rotary Drum Pelletizer/Agglomerator

Project Location:

Canada

Industry:

Carbon Black

Material:

Carbon Black

Project Engineer:

FEECO International, Inc.
